## 3. HTTP API Transaction

### 3.1 Transaction

The HTTP API Transaction starts from a request from a client Application, usually a web browser. The request is processed by the web server on the IP Camera, then send the response back to the client application. The HTTP APP is taken in GET form. If the request is successful, the IP Camera will return a HTTP header contains 200 OK. The HTTP Body will contain actual data or error message if an error occurs.

For describe convenience, we use some short words to instead the long expressions. The follows are several regulations:

1. The italics and bold will be replaced by the value behind the symbol “=”.
2. The URL must follow the standard way of writing a URL.(RFC\_3986:Uniform Resource Identifiers (URI) Generic Syntax);that is ,spaces and other reserved characters (“;”, “/”, “?”, “:”, “@”, “=”, “+”, “,” and “\$”) within a <paramName> or a <paramValue> must be replaced with %<ASCII hex>.For example ,the blank must be instead with %20.
3. To describe the range of the configuration, we use some symbols such as “[ ]”, “{ }” and so on. For example : “[0-100]” denotes a integer not less than 0 and not larger than 100. “[0,1,2,3]” denotes the valid value of a integer among 0,1,2 and 3.
4. In the request and response, we use “[ ]” to denote an array. The index is usually a integer and start form 0.
5. The parameter value has several types: string, integer, bool and float.Integer is 32 bits.The range of bool is “true” and “false”.

The below is an example of a transaction:

Request	GET http://<ip>/cgi-bin/configManager.cgi?action=getConfig&name=VideoColor
---------	--

<b>Description</b>	Get VideoColor configuration.
<b>Response</b>	<p>HTTP/1.0 200 OK  Content-Type:text/plain</p> <p><b>head</b>.Brightness=50  <b>head</b>.Contrast=50  <b>head</b>.Hue=50  <b>head</b>.Saturation=50  <b>head</b>.TimeSection=1 00:00:00-24:00:00</p>
<b>Comment</b>	<p>In above table, <b>head</b>= table.VideoColor[<i>ChannelNo</i>][<i>ColorConfigNo</i>]  <i>ChannelNo</i> = video channel index,  <i>colorConfigNo</i> = color config index.</p> <p>0 = Color Config 1  1 = Color Config 2  ...  We can also request the single config.  For example:  <b>Request :</b>  <b>GET</b> http://10.7.2.4/cgi-bin/configManager.cgi?action=getConfig&amp;name=table.VideoColor[0][0].Brightness  <b>Response:</b>  HTTP/1.0 200 OK  Content-Type:text/plain  table.VideoColor[0][0].Brightness=50</p>

## 3.2 Authentication

The IP Camera supplies two authentication ways: basic authentication and digest authentication. Client can login through: <http://<ip>/cgi-bin/global.login?userName=admin>. The IP camera returns 401. Then the client inputs a username and password to authorize.

For example:

1. When basic authentication, the IP camera response:

401 Unauthorized  
WWW-Authenticate: Basic realm="XXXXXX"

Then the client encode the username and password with base64, send the following request:

Authorization: Basic VXZVXZ.

2. When digest authentication, the IP camera response:

WWW-Authenticate: Digest realm="DH\_00408CA5EA04", nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad", stale=False, qop="auth";

The client calculates the digest using username, password, nonce, realm and URI with MD5, then send the following request:

Authorization: Digest username="admin", realm="DH\_00408CA5EA04", nc=00000001, cnonce="0a4f113b", qop="auth", nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad", uri="cgi-bin/global.login?userName=admin", response="65002de02df697e946b750590b44f8bf"
